Date	[date]

This document is issued in draft until every bracketed field is completed and it is signed and dated. An unsigned, undated profile is treated at a selection stage as a draft, and a draft evidences nothing.

The problem

On a major project the permanent works have an owner, a designer, a programme and a budget somebody defends. The temporary site does not. The compound, welfare, temporary power and water, access, laydown, logistics, waste, security and workforce accommodation end up as twenty or more separate subcontracts — none of them the work the contractor was appointed to do, all of them consuming the attention of the people who should be building.

The cost is set at bid stage from the last project's rates, by somebody who will not run this one, and tested for the first time in the week the site opens. On a large programme that is a very large number to leave to inheritance.

What ETABLIX does

One contract, one programme, one budget and one accountable organisation for the entire temporary site. The contractor gets its senior people back onto the permanent works. The client gets a site cost that was worked out rather than assumed.

SPECIFY	The site establishment requirement, built from the programme, the location and the real workforce — not from a benchmark rate. Compound layout, welfare, temporary power and water, access and haul routes, laydown, logistics, waste, security, accommodation and catering.
QUANTIFY	The demand model underneath it: people by month, power by phase, water, waste, vehicle movements. A number that can be defended line by line to a client, a lender or an auditor.
PROCURE	Package scopes, enquiries to a qualified supply chain, like-for-like bid comparison, and an award recommendation with the comparison shown.
CONTROL	Supplier performance managed against the specification for the life of the programme, reported monthly against the demand model rather than against last month.

Scope of services

Category	Covered
Site establishment	Compound layout and phasing, offices, stores, laydown, hardstanding, fencing, gates, signage — and demobilisation and reinstatement, priced at the start rather than found at the end.
Welfare and accommodation	Canteens, drying rooms, sanitary and medical provision sized to the peak workforce; construction camps and managed accommodation, catering, housekeeping and transport to site.
Temporary utilities	Power generation or grid connection, distribution, lighting, potable and process water, sewage, telecoms and site-wide connectivity.
Access and logistics	Haul roads, wheel wash, traffic management, delivery scheduling, offload and materials handling.
Security, waste and environment	Manned guarding, CCTV, perimeter and access control; waste streams and routes, recycling, spill, dust and noise control.

Where this is worth the most

On remote, large and multi-contractor programmes — LNG, power generation, transmission, industrial and data centre construction — three things are true at once, and together they make the temporary site a major project in its own right.

A thin local supply chain	Almost nothing can be procured reactively. What is not planned twelve to eighteen months out arrives late or at cost. Planning it early is the single largest saving available on this kind of site.
A workforce beyond the local catchment	The camp becomes a small town: accommodation, catering, water, sewage, medical, transport, security. It is a programme in its own right and it is usually appended to somebody else's scope.
Several contractors on one site	Shared roads, power, welfare, security and waste. Procured separately by each party they compete for the same regional capacity, and the last to ask pays the most for the least. Procured once, across the site, they do not.

- **One camp, one power strategy, one logistics plan, one security arrangement — specified once for the whole site.** That is the saving that cannot be recovered by negotiation later, because by then five contractors have each procured their own.

How we work

Model		Commercial arrangement
A	Advisory	ETABLIX specifies, quantifies and tenders. The client procures and manages. Fixed fee.
B	Management Integrator	ETABLIX specifies, tenders, recommends and manages performance. The client contracts directly with each supplier and pays them directly — ETABLIX holds no supply chain money and takes no supplier margin. Management fee.
C	Prime Service Contractor	ETABLIX contracts for the whole temporary site as a single package and carries the supply chain. One contract, one point of accountability.

Model B is the usual starting point on a large programme: a single accountable organisation for the site, without moving supply chain risk, and a bid comparison that is genuinely independent because nothing in it is marked up.

Leadership

Justin Ngolu Nseyi, Managing Director. Chartered Construction Manager (MCIOB), MSc BIM Management, BSc (Hons) Construction Management. Fourteen years in construction and programme delivery with Turner & Townsend, Mott MacDonald, the West Midlands Combined Authority and GE Vernova.

The method offered here is the method he ran. At GE Vernova – Grid Solutions he was the single person accountable for planning, procuring, integrating and controlling the temporary infrastructure and workforce-living systems that keep major projects operational. He held it across multiple concurrent sites, from tender stage through to handover, throughout Northern and Southern Europe including the United Kingdom and the Republic of Ireland: one accountable interface from initial requirements and mobilisation, through daily operation, to demobilisation and reinstatement.

On the Skye Reinforcement Project in Scotland he defined, procured and ran a 309-bedroom worker accommodation village over 36 months, specifying it as five packages — civils, modular accommodation, furniture and fit-out, kitchen and dining, and facilities management — and then placing the running of the whole village with a single managing contractor. Other work has included the grid connection programme for a 1,400 MW offshore wind farm, high-voltage substation and transmission construction, rail upgrades in live operational environments, and public infrastructure delivered from RIBA stage 0 to handover. He works in English and French.

Working internationally

ETABLIX is a United Kingdom company and works through established local partners outside the UK. The partner brings entity, licences, people, plant and local supply chain; ETABLIX brings the specification, the demand model, the procurement discipline and the reporting. Local delivery stays in local hands; the site cost stays under one method.

Next step

A thirty-minute call, and if it is useful, a single site taken as a first piece of work: a fixed scope, a fixed duration and a written report on what the site establishment should cost and why. It is deliberately small, because it is the quickest way for both sides to judge the method on something real.
